Additional resources

Below is a list of additional readings as you continue to explore 'React hooks and custom hooks'.

In particular, to complement your learning in the 'Advanced hooks' lesson, you can work through the following:

- The [useReducer hook reference](#) on Reactjs.org's website discusses the basics of **useReducer**, along with specifying initial state and lazy initialization.
- The Beta version of Reactjs.org's docs has a reference on [the syntax and usage of the useReducer hook](#) which complements the previous link.
- The Beta version of Reactjs.org's docs also has a reference on [using the useRef hook](#) which is a great example of various options that are available when working with the **useRef** hook.
- The [Reusing Logic with Custom Hooks](#) reference on Reactjs.org's Beta version discusses the dynamics of custom hooks and provides a few practical examples to complement the theory behind them.
